TETRADOTOXIN

(Injection of Neurotoxin of Tetradons)

REPORT NO. 249

25 July 1946

MEDICAL ANALYSIS SECTION 5250th Technical Intelligence Company APO 500

297101

TETRADCTOXIN

(Injection of Neurotoxin of Tetradons)

SOURCE: Tokyo, Japan.

IMPORTANCE: Not previously reported. A neurotoxin extracted from tetradons. No identical product is recorded in available standard American references.

DESCRIPTION: Twelve amber glass ampuls, each containing 1 cco of tetradotoxin, are packaged twelve per cardboard container. The solution in each ampul is slightly yellowish and contains a fine sediment, probably the result of decomposition.

SUMMARY OF GENERAL INFORMATION: Tetradotoxin is a neurotoxin extracted from tetradons and its action is due to its irritation of both the peripheral and central nervous systems. Its degree of action is claimed to be directly related to the dosage. Small doses paralyze the sensory nerves, motor nerves and the central spasm center. Larger doses cause paralysis of the vagus. Large doses paralyze the motor nerves of the blood vessels, the diaphragm and finally result in death from respiratory paralysis. Adequate therapeutic dosage consists of employing an amount sufficient to attain sensory and motor paralysis but to avoid respiratory paralysis.

Tetradotoxin is claimed to possess anodyne, antispasmodic and sedative properties. It is as powerful in action as curare, slower than morphine but nore lasting (12 to 20 hours) than the latter. The average therapeutic dose is 1 cc., injected subcutaneously, and this is 1/14 of the minimum. Mobbil dose for humans. Standardization of the product is made by determining the minimum lethal dose per kilogram of body weight for marmots. One-fourteenth of this MLD is then diluted fifty times, 0.5% phenol is added, and 1 cc. volumes are ampuled.

The literature accompanying the product has been translated and embodied in this report. It describes the physiological action of tetradotoxin, its indications, contra-indications, directions and dosage (including alternative dosage tables), cautions, storage, packaging and manufacturer.

No information is furnished on the chemical nature of the neurotoxin. Results of detailed comparative tests with other drugs possessing all or part of the neurotoxin's properties are not given. The source of this drug is novel.

TETRADOTOXIN

Tetradotoxin is the toxins of tetradons discovered by Yoshizumi Tahara, Doctor of Pharmacology and formerly Chief of the Tokyo Sanitary Research Laboratory attached to the Home Office. The product now being used in medical treatment is manufactured under the supervision of Doctor Tahara. The quantity equivalent to 1/14 of the minimum lethal dose per kilogram body weight of a marmot is diluted fifty times (assuming the average body weight of humans to be 50 kg.) and is enclosed in 1 cc. ampules containing 0.5% phenol and sterilized. The contents of one ampule constitute one dose (1/14 of lethal dose of humans).

PHYSIOLOGICAL ACTION OF TETRADOTOXIN: Tetradotoxin is one type of poison to the nerves causing an irritation of both the peripheral nervous system and the central nerves, In small dosages, first, it paralyzes the sensory nerves, next the motor nerves and finally the central spasm center. In slightly larger doses it paralyzes the vagus nerve and intercepts the inhibitory action. In large dosages it paralyzes the motor nerves of the blood vessels, the diaphragm and the respiratory center finally causing death. However, if a proper dose is administered (the amount that paralyzes the sensory and motor nerves but not the respiratory center) it displays an action that morphine and other anesthetics do not attain . that is, an anodyne, antispasmodic and sedative action - and in addition it is as powerful as curare. Moreover, it has been proven by numerous clinical experiments and precise animal tests that it does not cause any secondary reactions. It is being applied and recommended in various medical treatments.

INDICATIONS:

- l. As an anodyne it is markedly effective against pain caused by leprous neuralgia, general neuralgia, rheumatism of the muscles and joints, cuts, burns, bruises, stiff shoulders, etc. It completely cures neuralgia and rheumatism of the muscles and joints except in chronic cases.
- 2. As an antipruritic it relieves and speeds the recovery from skin itch in winter, pruritis, Vidal's disease, strophulus, scabies, ringworm and dermatitis,

3. As a respiratory sedative it may be applied in asthma

and whooping cough,

4. As an antispasmodic it may be applied in stomach and other spasms. It is especially effective in spasms in tetany.

5. It has a blood congesting action and is even effective where Yokimbine is not in impotence and female apathy,
6. As a urinary sedative it is effective in onuresis.

The above mentioned indications are listed based on the reports of many clinical doctors and there is a tendency which indicates that the scope of medical treatment will be greatly endlarged hereafter,

CONTRA-INDICATIONS: Records of experiments to date show that repeated use of this drug causes congestion of the mucous membrane of the bladder. At first, this congestion is limited to the apen but repeated use causes a marked congestion of the whole mucous membrane of the bladder as well as the urethrad Consequently, this drug must not be used in cases of irritations of the bladder or the urethrad

DIRECTIONS AND DOSAGES: The contents of one ampule, that is 1 cc., constitutes an average dose but this should be adjusted in accordance with physical condition, age and weight of the patient and conditions of the disease (if necessary it may gradually be increased with caution up to 3 cc.). Usually injection is by the hypodermic route once a day or on alternate days shown as follows (adult dose).

1st Method

1st day = 0.5 cc. 2nd day = 0.6 cc. 3rd day = 0.7 cc. 4th day = 0.8 cc. 5th day = 0.9 cc. 6th day = 1.0 cc. 7th day = 1.1 cc. 8th day = 1.2 cc. 9th day = 1.3 cc. 10th day = 1.4 cc.

8th	day	-	1.0	cc.
9th	day	4	1.0	cc.
Oth	day	-	1.0	cc.

CAUTIONS: It is best to inject tetradotoxin subcutaneously on the upper arm or shoulder after the usual precautions. Draw the tetradotoxin into a sterilized syringe and inject immediately. Although it may be injected into the upper thigh, hip, the pit of the stomach, or parts adjacent to a focal infection, great care should be taken so as not to injure any large veins. It is slower in action than morphine but its effect is more lasting - twelve to twenty hours. Even if used in regular quantities it does not cause any cumulative action but it seems to be slightly habit forming. In some patients it causes an acute abnormal sensation of the mouth and tip of the tongue, head congestion, headache, etc., but it must be understood that the above reactions vary with the individual's idiosyncrasies. However, as these are not secondary reactions, medication may be continued without fear.

STORAGE: Store with the same cautions as any poisonous drug.

PACKAGING:

1 cc. - 6 ampules 1 cc. - 12 ampules
